*Maine Medical Center wants your feedback for a new research study.*

**The ACCESS Study: Does early heart catheterization after cardiac arrest improve survival?**

The ACCESS Study is a research study being done at Maine Medical Center in Portland, Maine and other hospitals across the US for people brought to an emergency department after cardiac arrest.

This research study will look at the best timing for heart catheterization in patients with certain findings on their ECG test. We don't know the best timing; there are pros and cons to each approach. This study aims to answer the question: Does early heart catheterization after cardiac arrest improve survival and the ability to return to pre-cardiac arrest activities?
