

FOCUS ON VISION

by Dr. Mark Skowron

NO-LINE BIFOCALS

If you need glasses for distance viewing and reading, as well as any distance in between, you might want to have a look at “progressive lenses.” These lenses have the advantage of not having a telltale line between prescriptions as do bifocals. If necessary, a third prescription can be introduced in between for middle distance, creating trifocals. Without any line between prescriptive strengths, progressives provide smooth, continuous vision at near, middle, and distant focal ranges, with no unsettling image jumps. As a result, corrected vision provides more natural vision than bifocals or trifocals. While progressive lenses may require a period of adjustment, wearers often find that their utility and cosmetic appeal make an unbeatable combination.

While eyeglass lenses are prescribed to correct all kinds of vision problems, prescription lenses have come a long way—offering you the opportunity to truly customize your eyeglasses and make a statement about how you choose to look at the world. At SKOWRON EYE CARE, our experienced optometry professionals work closely with you to select the proper frames to fit your budget as well as your cosmetic, lifestyle, and vision needs. At Skowron Eye Care, our mission is your vision.

P.S. “Presbyopia” (the loss of focusing power associated with middle age) is responsible for the need for reading glasses.
